In just seconds, potential interactions can be reviewed by class, generic drug, or trade name. Comprehensive information on drug-drug and drug-food interactions is provided in a quick-reference format to enhance the speed and accuracy of therapeutic decision making.

Pain Management and the Opiod Epidemic-National Academies of Sciences, Engineering, and Medicine 2017-09-28 Drug overdose, driven largely by overdoses related to the use of opioids, is now the leading cause of unintentional injury death in the United States. The ongoing opioid crisis lies at the intersection of two public health challenges: reducing the burden of suffering from pain and containing the rising toll of the harms that can arise from the use of opioid medications. Chronic pain and opioid use disorder both represent complex human conditions affecting millions of Americans and causing untold disability and loss of function. In the context of the growing opioid epidemic, the U.S. Food and Drug Administration (FDA) launched an Opioids Action Plan in late 2015. As part of this plan, the FDA asked the National Academies of Sciences, Engineering, and Medicine to convene a committee to update the state of the science on pain research, care, and education and to identify actions the FDA and others can take to respond to the opioid epidemic, with a particular emphasis on the development of a formal method for incorporating individual and societal considerations into its risk-benefit framework for opioid approval and monitoring.
